

Abstract

5 The combined radial/axial bearing (1, 18, 20, 22) according to the invention is distinguished in that an outer running track (13) of the axial bearing is formed by a radially inward-pointing rim (5) of the cylindrical sleeve (2), said rim adjoining an axially
10 outward-projecting cylindrical portion (4) of the sleeve (2), while an inner running track (14) of the axial bearing is formed by a radially outward-pointing rim (8) of an inner ring (7) of the radial bearing or by a running disk (23), prolongations of axes of
15 rotation (16) of the cylindrical rolling bodies (9) of the radial bearing intersecting with axes of rotation (17) of the cylindrical rolling bodies (12) of the axial bearing virtually at a center of the cylindrical rolling bodies (12) of the axial bearing.

20

This ensures that both radial and axial loads can be transmitted in the case of a small radial construction space of the overall bearing arrangement.
